

Marcin Ciarka

Technical Advisor · Senior Full-Stack Engineer — DeFi

Full-stack engineer, frontend-focused, with 9+ years shipping production software and the last four building DeFi products — lending, leverage, yield and risk automation across Maker, Aave, Spark, Morpho Blue, Euler, Fluid, Compound and Ajna. I take repositories from empty to production: frontend architecture, on-chain data layers, indexers, monorepo and CI foundations.

EXPERIENCE

Technical Advisor (contract) · Stealth DeFi platform (under NDA)

2026 — Present

- ▶ Self-custodial all-in-one app — earn, borrow, multiply, loop and perps, every position in the user's own Safe account. Scaffolded the monorepo and its Ponder indexer, with on-chain calls run parallel to indexer queries for sub-second loads.
- ▶ Built the cost-basis and PnL engine — entry price read at the event block, with Chainlink and historical-API fallbacks — and put six protocols behind one set of product views: Morpho Blue, Euler v2, Fluid, Compound v3, Sky and Maple.

Senior Full-Stack Engineer · Lazy Summer Protocol · Summer.fi

2024 — 2026

- ▶ Took the next-generation Earn app from an empty repository to production, owning the frontend architecture as the protocol approached \$200M TVL and moving wallet connectivity onto Viem and Wagmi v2.
- ▶ Built the vault simulation engine — position metrics standardised on real-time net value rather than gross earnings — plus an institutional RWA dashboard with two-layer auth (AWS Cognito for web2 roles, wallet for web3).

Senior Full-Stack Engineer · Summer.fi Pro

2023 — 2025

- ▶ Took the multi-protocol Borrow / Multiply / Earn suite onto Layer 2 — Maker, Aave v2/v3, Spark, Morpho Blue and Ajna behind shared libraries and a config engine.
- ▶ Built the risk-automation layer with trigger cross-validation, so concurrent Stop-Loss, Auto-Buy and Auto-Sell can never collide or commit an impossible LTV; reactive state machines for proxy creation and approvals made 1-click leverage non-blocking.

DeFi Frontend Engineer · Oasis.app

2022 — 2023

- ▶ Grew a Maker-native vault product into a multi-protocol one, shipping the first frontend integration for Spark Lend and Stop-Loss automation held 2.5% clear of each protocol's liquidation threshold.
- ▶ Built Aave stETH/ETH yield engines and cached multi-network portfolio data that rides out traffic spikes which would otherwise hit RPC rate limits.

Full-Stack Engineer · Softax

2016 — 2022

- ▶ Six years of regulated enterprise work: vehicle-leasing applications for a major automotive group, retail banking front-ends for two banks, and the back-office tools their operating teams ran on.

SELECTED PROJECTS

ChainVibe — chainvi.be

Sub-second on-chain price and transaction streaming: one server-side WebSocket stream fanned out to every client, solving RPC rate-limiting. Published as [@chainvibe/components](#), a one-dependency React ticker under 6 kB gzipped.

React · TypeScript · Bun · WebSockets · npm library

Summer Resonance — resonance.summer.fi

Live DeFi telemetry you can hear: deposit, withdraw and TVL movement from the Lazy Summer Protocol mapped to a generative Web Audio soundscape, with TVL easing on BigNumber.js math and GPU-accelerated WebGL animation.

Next.js · TypeScript · WebSockets · Web Audio · WebGL

SKILLS

CORE

TypeScript, React, Next.js (App Router, Server Components), Node, Bun; PostgreSQL with Prisma / Kysely; AWS (ECR, ECS, Cognito) and SST; Turborepo, Vite libraries, CI/CD; CSS Modules and Tailwind; WebGL and Web Audio as a personal interest.

WEB3

Viem, Wagmi v2, WalletConnect v2, Safe smart accounts, EIP-1559; Ponder indexers, Chainlink feeds, BigNumber.js precision math; Morpho Blue, Euler v2, Fluid, Compound v3, Aave v2/v3, Spark, Maker, Sky, Maple, Ajna.
